Ex.No.: 8	WORKING WITH MULTIPLE TABLES	
Date: 3/9/24		

Objective

After the completion of this exercise, the students will be able to do the following:

- Write SELECT statements to access data from more than one table using equality and nonequality joins
- · View data that generally does not meet a join condition by using outer joins
- Join a table to itself by using a self join

Sometimes you need to use data from more than one table.

Cartesian Products

- · A Cartesian product is formed when:
- A join condition is omitted
- A join condition is invalid
- All rows in the first table are joined to all rows in the second table
- To avoid a Cartesian product, always include a valid join condition in a WHERE clause.

A Cartesian product tends to generate a large number of rows, and the result is rarely useful. You should always include a valid join condition in a WHERE clause, unless you have a specific need to combine all rows from all tables.

Cartesian products are useful for some tests when you need to generate a large number of rows to simulate a reasonable amount of data.

Example:

To displays employee last name and department name from the EMPLOYEES and DEPARTMENTS tables.

SELECT last_name, department_name dept_name FROM employees, departments;

Types of Joins

· Equijoin

- · Non-equijoin
- · Outer join
- · Self join
- Cross joins
- Natural joins
- Using clause
- Full or two sided outer joins
- Arbitrary join conditions for outer joins

Joining Tables Using Oracle Syntax

SELECT table 1.column, table 2.column

This query was completed in earlier releases as follows:

SELECT e.last_name, e.department_id, d.department_name FROM employees e, departments d WHERE d.department_id = e.department_id (+);

FULL OUTER JOIN

Example:

SELECT e.last_name, e.department_id, d.department_name
FROM employees e
FULL OUTER JOIN departments d
ON (e.department_id = d.department_id);
This quarty retrieves all rows in the FMPLOYEES table, even if there is no i

This query retrieves all rows in the EMPLOYEES table, even if there is no match in the DEPARTMENTS table. It also retrieves all rows in the DEPARTMENTS table, even if there is no match in the EMPLOYEES table.

Find the Solution for the following:

1. Write a query to display the last name, department number, and department name for all employees.

Select e. last_name, e. department_id, d. department_name

From employees e, department d

where e. department_id = d. department_id;

2. Create a unique listing of all jobs that are in department 80. Include the location of the department in the output.

Select distinct job-id, location-id

From employees, departments
where employees, department-id = departments. department_id

And employees. department_id = 80;

3. Write a query to display the employee last name, department name, location ID, and city of all employees who earn a commission

Select e. last_name, d. department_name, d. location_id. le city

From employee e, departments d. locations of

where a department_id = d. department_id

And

d. location_id = l. location_id

And e. commission_pet us not null;

- From employees, departments

 where employees department id = departments . department id

 And last name like "1. a 1.";
- 5) Select e. last_name, e. job_id, e. department_id, d. department_name
 From employees e Join departments.d

 On (e. department_id = d. department_id)

 Join locations l

 On (d. locations_id = l. location_id)

 where lower (l. city) = 'toronto';

sound trouble to be to the the sound name to be a department name

from single gers a defout and of

the national at the tradem at

be transport by he transports a water

5

C

00

9. desc job-grades

Select e last-name, e. job-id. d. department name, e-salary, i-grade-level

From employees e. department d. job-grades;

where e. department-id = d. department-id

And e. salary Between i lowest-sal and j. highest-sal;

ections reglegis , depotred is depotroute depotrument, is

- Display the employee last name and department name for all employees who have an a(lowercase) in their last names. P
- 5. Write a query to display the last name, job, department number, and department name for all employees who work in Toronto.
- 6. Display the employee last name and employee number along with their manager's last name and manager number. Label the columns Employee, Emp#, Manager, and Mgr#, Respectively Select w. last_name "Employers", w. employer_id "EMP#", m. last_name "Manager", m. employer_id "Mgr#", From employees w Join employees m (w. manager_id=m. employer_id); 7. Modify lab4_6.sql to display all employees including King, who has no manager. Order the results by the employee number.
- Suleit w. last_name "Employee", w. employee_id "EMP#", m. Last_name "Manager", m. employee_id "Mgr#",
- From employees w Left outer join employees m on (w. manager_id = m. employee_id);
- 8. Create a query that displays employee last names, department numbers, and all the employees who work in the same department as a given employee. Give each column an appropriate label
- select e department-i'd department, e last-name employée. c. last _name colleague

 From employers e Join employers (
 on le deportment_id = c. department_id)

 where e employer id 25 c. employer id

 order by e deport ment_id, e. last_name, c. last_name;

 9. Show the structure of the JOB_GRADES table. Create a query that displays the name, job,

こうしゅう こうこうこうこうこう こうこうこう

- department name, salary, and grade for all employees

10. Create a query to display the name and hire date of any employee hired after employee Davies.

Select e last_name, e. hire_date from employees e join employees davies on (davi es · last_name = 'davies') whom davies · hire_date < e. hire_date;

11. Display the names and hire dates for all employees who were hired before their managers, along with their manager's names and hire dates. Label the columns Employee, Emp Hired, Manager, and Mgr Hired, respectively.

Select w. last name, w. hire_date, m. last_name, m. hire_date

From employees w Join employees m

On (w. manager_id = m. employee - id)

where we hire_date & m. hire_date;
